

## Chapter 808

# Confidence Intervals for Spearman's Rank Correlation

## Introduction

This routine calculates the sample size needed to obtain a specified width of Spearman's rank correlation coefficient confidence interval at a stated confidence level.

Caution: This procedure requires a planning estimate of the sample Spearman's correlation. The accuracy of the sample size depends on the accuracy of this planning estimate.

## Technical Details

This procedure is based on the results of Bonett and Wright (2000). Assuming a bivariate normal population with population rank correlation  $\rho$ , the transformation of the sample Spearman's rank correlation from  $r$  to  $z_r$

$$z_r = \frac{1}{2} \ln \left( \frac{1+r}{1-r} \right)$$

is approximately normally distributed with variance  $1/(n-3)$  (Fisher, 1921). The lower and upper confidence limits for  $\rho$  are obtained by computing

$$z_r \pm z_{1-\alpha/2} \sqrt{\frac{1 + \frac{r^2}{2}}{n-3}}$$

to obtain  $z_L$  and  $z_U$ . The values of  $z_L$  and  $z_U$  are then transformed back to the correlation scale using the inverse transformations

$$r_L = \frac{\exp(2z_L) - 1}{\exp(2z_L) + 1}$$

and

$$r_U = \frac{\exp(2z_U) - 1}{\exp(2z_U) + 1}$$

One-sided limits may be obtained by replacing  $\alpha/2$  by  $\alpha$ .

For two-sided intervals, the distance from the sample correlation to each of the limits may be different. Thus, instead of specifying the distance to the limits we specify the width of the interval,  $W$ .

## Confidence Intervals for Spearman's Rank Correlation

The basic equation for determining sample size for a two-sided interval when  $W$  has been specified is

$$W = r_U - r_L$$

For one-sided intervals, the distance from the sample correlation to limit,  $D$ , is specified.

The basic equation for determining sample size for a one-sided upper limit when  $D$  has been specified is

$$D = r_U - r$$

The basic equation for determining sample size for a one-sided lower limit when  $D$  has been specified is

$$D = r - r_L$$

Each of these equations can be solved for any of the unknown quantities in terms of the others.

---

## Confidence Level

The confidence level,  $1 - \alpha$ , has the following interpretation. If thousands of samples of  $n$  items are drawn from a population using simple random sampling and a confidence interval is calculated for each sample, the proportion of those intervals that will include the true population correlation is  $1 - \alpha$ .

## Example 1 – Calculating Sample Size

Suppose a study is planned in which the researcher wishes to construct a two-sided 95% confidence interval for the population Pearson correlation such that the width of the interval is no wider than 0.08. The researcher would like to examine a large range of sample correlation values to determine the effect of the correlation estimate on necessary sample size. Instead of examining only the interval width of 0.08, widths of 0.06 and 0.10 will also be considered.

The goal is to determine the necessary sample size.

### Setup

If the procedure window is not already open, use the PASS Home window to open it. The parameters for this example are listed below and are stored in the **Example 1** settings file. To load these settings to the procedure window, click **Open Example Settings File** in the Help Center or File menu.

#### Design Tab

Solve For .....	<b>Sample Size</b>
Interval Type .....	<b>Two-Sided</b>
Confidence Level (1 – Alpha).....	<b>0.95</b>
Confidence Interval Width (Two-Sided) .....	<b>0.06 0.08 0.10</b>
r (Sample Spearman's Correlation) .....	<b>-0.9 to 0.9 by 0.1</b>

## Output

Click the Calculate button to perform the calculations and generate the following output.

### Numeric Reports

- Confidence Level      The proportion of confidence intervals (constructed with this same confidence level, sample size, etc.) that would contain the true correlation.
- N                        The size of the sample drawn from the population.
- Confidence Interval Width      The distance from the lower limit to the upper limit.
- Target Width            The value of the width that is entered into the procedure.
- Actual Width            The value of the width that is obtained from the procedure.
- If r = 0.0                The maximum width for a confidence interval with sample size N.
- r                         The estimate of Spearman's rank correlation coefficient.
- Confidence Interval Limits      The lower and upper limits of the confidence interval.

#### Summary Statements

A single-group design will be used to obtain a two-sided 95% confidence interval for a single Spearman's rank correlation coefficient. The sample estimate of the Spearman's rank correlation is assumed to be -0.9. To produce a confidence interval with a width of no more than 0.06, 225 subjects will be needed.

Confidence Intervals for Spearman's Rank Correlation

**Dropout-Inflated Sample Size**

Dropout Rate	Sample Size N	Dropout- Inflated Enrollment Sample Size N'	Expected Number of Dropouts D
20%	225	282	57
20%	737	922	185
20%	1387	1734	347
20%	2067	2584	517
20%	2704	3380	676
20%	3255	4069	814
20%	3695	4619	924
20%	4014	5018	1004
20%	4205	5257	1052
20%	4269	5337	1068
20%	4205	5257	1052
20%	4014	5018	1004
20%	3695	4619	924
20%	3255	4069	814

- Dropout Rate The percentage of subjects (or items) that are expected to be lost at random during the course of the study and for whom no response data will be collected (i.e., will be treated as "missing"). Abbreviated as DR.
- N The evaluable sample size at which the confidence interval is computed. If N subjects are evaluated out of the N' subjects that are enrolled in the study, the design will achieve the stated confidence interval.
- N' The total number of subjects that should be enrolled in the study in order to obtain N evaluable subjects, based on the assumed dropout rate. After solving for N, N' is calculated by inflating N using the formula  $N' = N / (1 - DR)$ , with N' always rounded up. (See Julious, S.A. (2010) pages 52-53, or Chow, S.C., Shao, J., Wang, H., and Lohknygina, Y. (2018) pages 32-33.)
- D The expected number of dropouts.  $D = N' - N$ .

**Dropout Summary Statements**

Anticipating a 20% dropout rate, 282 subjects should be enrolled to obtain a final sample size of 225 subjects.

## Plots Section

### Plots

These plots show the sample size versus the sample correlation for the three confidence interval widths.

## Example 2 – Validation using Bonett and Wright (2000)

Bonett and Wright (2000), page 26, give an extension table of sample sizes for two-sided confidence intervals for Spearman correlations when the confidence levels are 95% and 99%. When the sample Spearman rank correlation is 0.3 and the interval width is 0.2, they obtain sample sizes of 334 and 574, respectively.

Note that we checked our results with this table and found a view differences which are obvious typos.

### Setup

If the procedure window is not already open, use the PASS Home window to open it. The parameters for this example are listed below and are stored in the **Example 2** settings file. To load these settings to the procedure window, click **Open Example Settings File** in the Help Center or File menu.
