Chapter 381

Mixed Models Tests for Two Means in a 3-Level Hierarchical Design (Level-2 Randomization)

Introduction

This procedure calculates power and sample size for a three-level hierarchical mixed model which is **randomized at the second level**. The goal of the study is to compare two group means. The study may be cross-sectional or longitudinal.

In a *cross-sectional* version of this design, students (first level units) are nested in classrooms (second level units) which are nested in schools (third level units). Each classroom is randomized into one of two intervention groups, e.g., treatment and control.

In a *longitudinal* version of this design, repeated measurements (first level units) are nested in patients (second level units) which are nested in clinics (third level units). Each patient is randomized into one of two intervention groups, e.g., treatment and control.

Note that companion procedures analyze the other cases in which the randomization occurs at the first, or third, level units.

Technical Details

Our formulation comes from Ahn, Heo, and Zhang (2015), chapter 6, section 6.3.2, pages 191-194. The hierarchical mixed model used for the analysis is

$$Y_{ijk} = \beta_0 + \delta X_{ijk} + u_i + u_{i(i)} + e_{ijk}$$

where

 Y_{ijk} is the continuous response of the k^{th} level-1 unit of the j^{th} level-2 unit of the i^{th} level-3 unit.

 β_0 is the fixed intercept.

 δ is the treatment effect of interest. It is the difference between the two group means.

 X_{iik} is an indicator variable that is 1 if j^{th} unit is in group 1 and 0 if it is in group 2.

 u_i is the level-3 random intercept effect for the i^{th} level-3 unit. It is distributed as $N(0, \sigma_3^2)$.

 $u_{j(i)}$ is the level-2 random intercept effect for the j^{th} level-2 unit. It is distributed as $N(0, \sigma_2^2)$.

 e_{ijk} is a random error term which is distributed as $N(0, \sigma_e^2)$.

 σ_{ν}^2 is variance of the level two (cluster) random effects.

 σ_e^2 is variance of the level one (subject) random effects.

Mixed Models Tests for Two Means in a 3-Level Hierarchical Design (Level-2 Randomization)

- σ^2 is the variance of Y_{ijk} , where $\sigma^2 = \sigma_e^2 + \sigma_2^2 + \sigma_3^2$.
- ρ_1 is the correlation among level-1 units which are in a particular level-2 unit. For fixed models like this, $\rho_1 = Corr(Y_{ijk}, Y_{ijk'}) = (\sigma_2^2 + \sigma_3^2)/\sigma^2$.
- ρ_2 is the correlation among level-2 units which are in a particular level-3 unit. For fixed models like this, $\rho_2 = Corr(Y_{ijk}, Y_{ij'k'}) = (\sigma_3^2)/\sigma^2$.
- *C* is the number of level-3 units.
- K_1 is the number of level-2 units per level-3 unit assigned to group 1.
- K_2 is the number of level-2 units per level-3 unit assigned to group 2.
- *M* is the number of level-1 units per level-2 unit.

The test of significance of the X_{ijk} term in the mixed model analysis is the test statistic of interest. It tests the difference of the two group means. Since these are asymptotic results, the specific type of mixed model is not stated.

Assume that $\delta = \mu_1 - \mu_2$ is to be tested using a z-test (large sample). The statistical hypotheses are H_0 : $\delta = 0$ vs. H_a : $\delta \neq 0$. The test statistic is the regression coefficient of the X_{ijk} term in a mixed model. It is given by

$$z = f((\overline{Y}_1 - \overline{Y}_2), C, K_1, K_2, M, \sigma, \rho_1, \rho_2)$$

where

$$\bar{Y}_g = \frac{1}{CK_gM} \sum_{i=1}^{C} \sum_{j=1}^{K_g} \sum_{k=1}^{M} Y_{ijk}, \qquad g = 1,2$$

The power can be calculated using

$$Power = \Phi \left\{ \left| \frac{\delta}{\sigma} \right| \sqrt{\frac{CK_2M}{\left[f_2(1+\frac{1}{\lambda})\right]}} - \Phi^{-1}(1-\alpha/2) \right\}$$

where $\lambda = K_1/K_2$ and $f_2 = 1 + M\rho_1 - M\rho_2$.

Mixed Models Tests for Two Means in a 3-Level Hierarchical Design (Level-2 Randomization)

Example 1 - Calculating Power

Suppose that a three-level hierarchical design is planned in which there will be students (level-1) which are nested in classrooms (level-2) which are nested in schools (level-3). This analysis will calculate the power for detecting the difference between two interventions in average response for a given configuration of students, classrooms, and schools. There will be one measurement per student and treatments will be applied to classrooms (level-2 units).

The analysis will be a mixed model of continuous data. The following parameter settings are to be used for the power analysis: $\delta = 0.8$; $\sigma = 2.6$; $\rho 1 = 0.01$; $\rho 2 = 0.005$; K1 = 3, A, C; K2 = K1; M = 5, C, C0, and C10 are the power analysis.

Setup

If the procedure window is not already open, use the PASS Home window to open it. The parameters for this example are listed below and are stored in the **Example 1** settings file. To load these settings to the procedure window, click **Open Example Settings File** in the Help Center or File menu.

Solve For	Power
Alpha	0.05
C (Level 3 Units)	5
K1 (Level 2 Units Assigned to Group 1)	3 4 5
K2 (Level 2 Units Assigned to Group 2)	K1
M (Level 1 Units Per Level 2 Unit)	5 10 15
δ (Mean Difference = $μ1 - μ2$)	0.8
σ (Standard Deviation)	2.6
ρ1 (Correlation Among Level 1 Units)	0.01
ρ2 (Correlation Among Level 2 Units)	0.005

0.9831	750	5	5	5	15	0.8	2.6	0.01	0.005	0.05

Power The probability of rejecting a false null hypothesis when the alternative hypothesis is true.

N The total number of Level-1 units.

C The number of Level-3 units.

K1 and K2 The average number of Level-2 units per Level-3 unit assigned to groups 1 and 2, respectively.

M The average number of Level-1 units per Level-2 unit.

δ The mean difference in the response at which the power is calculated. $\delta = \mu 1 - \mu 2$.

σ The standard deviation of the Level-1 responses.

p1 The correlation among Level-1 units in a particular Level-2 unit.
p2 The correlation among Level-2 units in a particular Level-3 unit.

Alpha The probability of rejecting a true null hypothesis.

Summary Statements

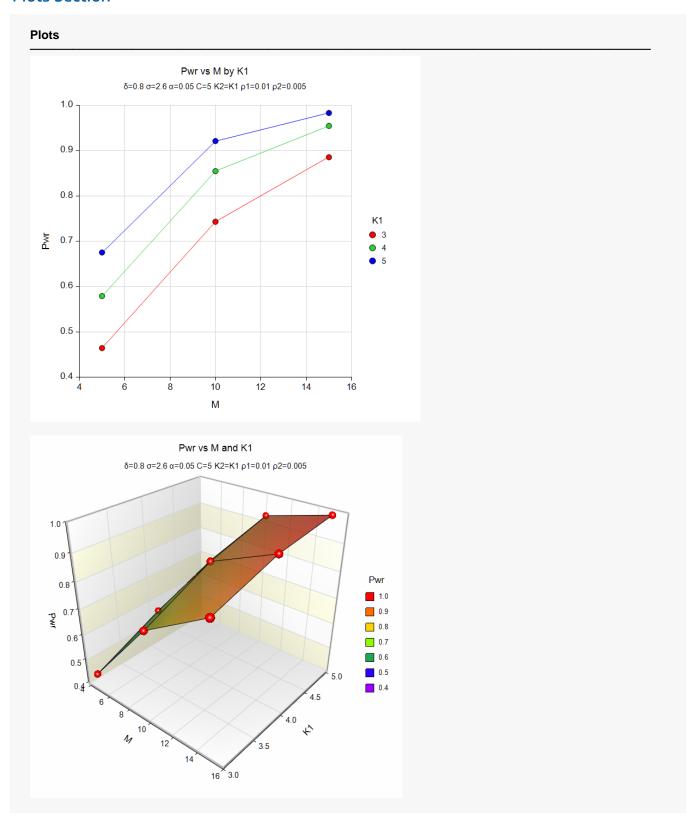

A 2-group 3-level hierarchical design will have level-1 units (e.g., students, subjects, or patients) in level-2 units (e.g., classes, clinics, or hospitals) in level-3 units (e.g., schools, regions, or networks) with random assignment of level-2 units to each of the 2 groups (level-2 randomization). This design will be used to test the difference between two means, using the appropriate term of the hierarchical mixed-effects model, with a Type I error rate (α) of 0.05. The standard deviation of level-1 units is assumed to be 2.6. The correlation of level-1 units within a level-2 unit is assumed to be 0.01, and the correlation of level-2 units within a level-3 unit is assumed to be 0.005. To detect a mean difference (μ 1 - μ 2) of 0.8, with 5 level-3 units, and within each level-3 unit, 3 level-2 units in Group 1 and 3 level-2 units in Group 2, with 5 level-1 units in each level-2 unit (for a grand total of 150 level-1 units), the power is 0.4643.

Mixed Models Tests for Two Means in a 3-Level Hierarchical Design (Level-2 Randomization)

Example 3 - Validation using Ahn, Heo, and Zhang (2015)

Ahn, Heo, and Zhang (2015) page 195 provide a table in which several scenarios are reported. We will validate this procedure by reproducing the first row of the table. The following parameter settings were for the analysis: power = 0.80; δ = 0.3; σ = 1; ρ 1 = 0.1; ρ 2 = 0.05; C = 12; M = 5; and α = 0.05. These settings resulted in a value of K1 and K2 (their N₂⁽⁰⁾) of 4 and an attained power of 0.865.

Setup

If the procedure window is not already open, use the PASS Home window to open it. The parameters for this example are listed below and are stored in the **Example 3** settings file. To load these settings to the procedure window, click **Open Example Settings File** in the Help Center or File menu.

Solve For	K1 (Number Level 2 Units Per Level 3 Unit
