Chapter 823

Tests of Mediation Effect in Logistic Regression

Introduction

This procedure computes power and sample size for a test of the mediation effect in a logistic regression with a binary dependent (output) variable Y and an independent (input) variable X. Interest focuses on the interrelationship between Y, X, and a third independent variable called the mediator M. The sample size calculations are based on the work of Vittinghoff, Sen, and McCulloch (2009). Note that their work has been extended in Vittinghoff and Neilands (2015). We are looking into adding those extensions in a later procedure.

Mediation Model

Vittinghoff, Sen, and McCulloch (2009) derived a sample size formula for testing the mediation effect based on testing the significance of β_M in the logistic regression model

$$\log\left(\frac{P}{1-P}\right) = \beta_0 + \beta_X X + \beta_M M$$

They showed that testing $\beta_M = 0$ is equivalent to testing for a significant mediation effect. In addition to the notation above, they use ρ_{XM} as the correlation between the independent variables X and M.

Calculating the Power

Power calculations are based on standard normal distribution. They proceed as follows:

1. Determine the critical value $z_{1-\alpha}$ from the standard normal distribution where α is the probability of a type-I error.

2. Calculate: $z_\beta = \sqrt{N\sigma_M^2\beta_M^2(1 - \rho_{XM}^2)P(1 - P)} - z_{1-\alpha}$.

3. Calculate: $\text{Power} = \Phi(z_\beta)$.

Notes

1. Use $\frac{\alpha}{2}$ instead of α for two-sided test.

2. $\sigma_M^2 = \Pr(M = 1)\Pr(M = 0)$ if M is binary.

Example 1 – Finding Sample Size

Researchers are studying the relationship between a binary dependent variable (Y) and an independent variable (X). They want to understand the impact of a third variable (M) on the relationship between X and Y, so they decide to carry out a mediation analysis. They decide to determine the sample size based on the significance test of the mediator term in a logistic regression. Using prior analyses, they decide to use β_M = 0.6, 0.8, 1.0, ρ_{XM} = 0.3, σ_M = 0.4, and P = 0.45. They set the power at 0.9 and the two-sided significance level at 0.05.

Setup

If the procedure window is not already open, use the PASS Home window to open it. The parameters for this example are listed below and are stored in the **Example 1** settings file. To load these settings to the procedure window, click **Open Example Settings File** in the Help Center or File menu.

Output

Click the Calculate button to perform the calculations and generate the following output.

Numeric Reports

Numeric Results
───

Solve For: N (Sample Size)
Alternative Hypothesis: Two-Sided
Hypotheses: H0: $\beta_M = 0$ versus H1: $\beta_M \neq 0$
───

Power	Sample Size N	Regression Coefficient of M β_M	Correlation of X and M ρ_{XM}	Standard Deviation of M σ_M	Marginal Prevalence of Y P	Alpha
0.9000	810	0.6	0.3	0.4	0.45	0.05
0.9003	456	0.8	0.3	0.4	0.45	0.05
0.9004	292	1.0	0.3	0.4	0.45	0.05
───

Model $\log(P/(1 - P)) = \beta_0 + \beta_X(X) + \beta_M(M)$.
X   The primary predictor. It is an independent variable.
M   The mediator. It is a continuous variable.

Power   The probability of rejecting a false null hypothesis when the alternative hypothesis is true.
N   The number of observations on which the multiple regression is computed.
β_M The regression coefficient of the mediator in the model.
ρ_{XM} The correlation between X and M.
σ_M The standard deviation of M.
P   The marginal prevalence of the binary outcome, Y. This is the probability in the population that Y = 1 when Y is the
        binary dependent variable that takes on the values 0 or 1.
Alpha   The probability of rejecting a true null hypothesis.

Summary Statements
───

A mediation effect (single group, binary response Y versus X with mediator M) design will be used to test whether
the mediation effect (β_M) is different from 0 (H0: $\beta_M = 0$ versus H1: $\beta_M \neq 0$). The comparison will be made using a
two-sided logistic regression test of the mediation effect coefficient (β_M), with a Type I error rate (α) of 0.05. The
continuous mediator, M, is assumed to have a standard deviation of 0.4. The correlation between X (primary
predictor) and M (mediator) is assumed to be 0.3. The marginal prevalence of the outcome variable is assumed to
be 0.45. To detect a mediation effect (mediator regression coefficient, β_M) of 0.6 with 90% power, the number of
needed subjects will be 810.
───

Dropout-Inflated Sample Size

Dropout Rate	Sample Size N	Dropout-Inflated Enrollment Sample Size N'	Expected Number of Dropouts D
20%	810	1013	203
20%	456	570	114
20%	292	365	73

Dropout Rate	The percentage of subjects (or items) that are expected to be lost at random during the course of the study and for whom no response data will be collected (i.e., will be treated as "missing"). Abbreviated as DR.
N	The evaluable sample size at which power is computed. If N subjects are evaluated out of the N' subjects that are enrolled in the study, the design will achieve the stated power.
N'	The total number of subjects that should be enrolled in the study in order to obtain N evaluable subjects, based on the assumed dropout rate. After solving for N, N' is calculated by inflating N using the formula N' = N / (1 - DR), with N' always rounded up. (See Julious, S.A. (2010) pages 52-53, or Chow, S.C., Shao, J., Wang, H., and Lokhnygina, Y. (2018) pages 32-33.)
D	The expected number of dropouts. D = N' - N.

Dropout Summary Statements

Anticipating a 20% dropout rate, 1013 subjects should be enrolled to obtain a final sample size of 810 subjects.

_____

This plot shows the relationship between sample size and effect size.

Example 2 – Validation using Vittinghoff (2009)

Vittinghoff et al. (2009) present an example on page 545 in which β_M = log 1.5 (0.4055), ρ_{XM} = 0.5, σ_M = 1, and P = 0.5. They set the power at 0.8 and the one-sided significance level at 0.025. The computed sample size is 255.

Setup

If the procedure window is not already open, use the PASS Home window to open it. The parameters for this example are listed below and are stored in the **Example 2** settings file. To load these settings to the procedure window, click **Open Example Settings File** in the Help Center or File menu.
